

Experiment No. 2

Setting up a Zoho Creator account and exploring the platform architecture and interface

1. Aim

To set up a Zoho Creator account, create a sample application, create and understand a form, report and dashboard, and explore the Develop, Deploy and Manage sections of the Zoho Creator platform.

2. Setting up Zoho Creator

I) Create the Sample Application

1. Open the Zoho Creator website and sign in or create a Zoho account.
2. From the Creator home page, choose the option to create a new application.
3. Select a blank application or a suitable template and provide the application name.
4. Create the application and open its design/development workspace.
5. Add the required components such as forms, reports and pages to build the application.

Sample Application

A sample **Student Management** application is created for this experiment. The application can collect student details through a form, display the stored records through reports, and summarize important information through a dashboard. This sample demonstrates the basic low-code application-building workflow in Zoho Creator.

II) Creating Form, Report and Dashboard

The following interface illustrations show the three main components required in the experiment.

II) Creating Form, Report and Dashboard

A. Creating a Form

Zoho Creator

Develop Deploy Manage

Forms

Reports

Pages

Workflows

Settings

Create Form

Student Registration

Name

Single Line

Email

Email

Department

Dropdown

Phone

Submit

Explanation: A form is used to collect information from users. In the sample application, a Student Registration form can contain fields such as Name, Email, Department and Phone Number. The fields are arranged in the form builder and configured with appropriate data types and validation. When the user submits the form, the record is stored in the application and can later be viewed through reports.

B. Creating a Report

Zoho Creator

Develop Deploy Manage

Forms

Reports

Pages

Workflows

Settings

Create Report

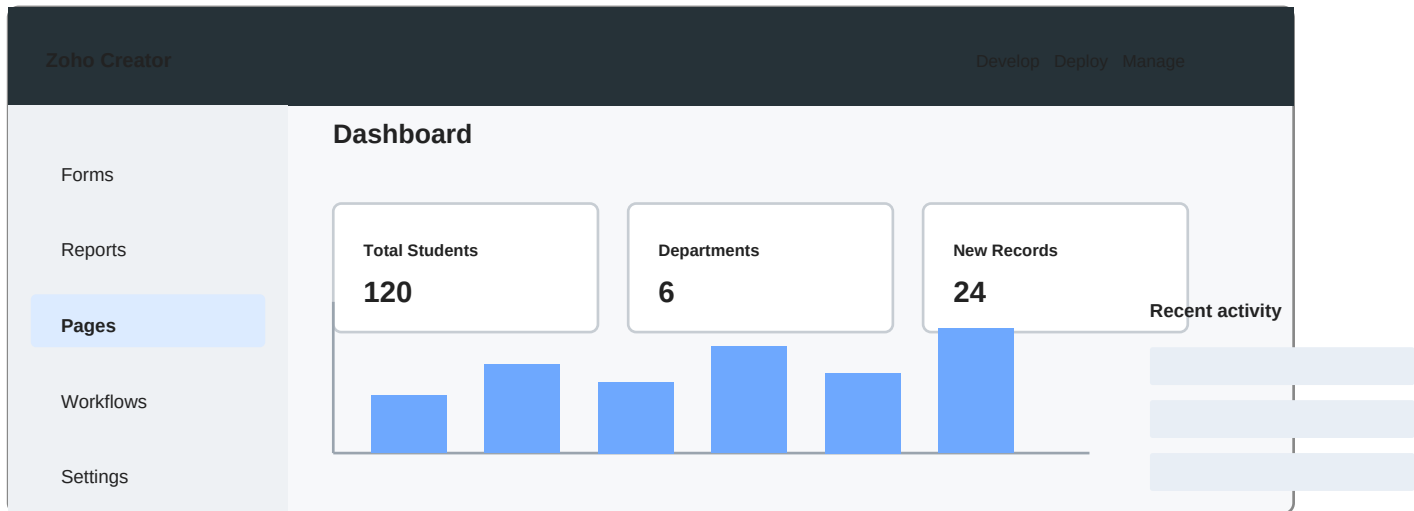

Based on: Student Registration

Name	Email	Department	Phone
Rithesh	rithesh@gmail.com	CSE	98765XXXXX
Student 2	student2@gmail.com	IT	98765XXXXX
Student 3	student3@gmail.com	ECE	98765XXXXX

Filter Sort Search Edit Delete

Explanation: A report is used to display and manage the records collected through a form. A report can present the records in a list or other suitable format. It allows users to search, filter, sort and manage the stored information. In this experiment, the Student Registration records are displayed as a report.

C. Creating a Dashboard

Explanation: A dashboard provides a visual summary of application information. It can contain panels, charts, reports, gauges, buttons and other components. The dashboard in the sample application can show the total number of students, departments and recent records. It gives users a quick overview of important information in one place.

3. Exploring the platform architecture and interface

A. Develop

- The Develop section is the main area used to build and customize the application.
- It is used to create forms, reports, pages, workflows and other application components.
- The visual interface reduces the amount of manual programming needed to build the application.

B. Deploy

- The Deploy section is used to make the completed application available to its users.
- It supports application sharing and configuration of access and user permissions.
- After testing, the application can be published so users can access the required features.

C. Manage

- The Manage section is used to administer the application after it has been created or deployed.
- It provides options for managing users, permissions, security and application settings.
- It helps administrators maintain the application and monitor its usage and configuration.

3. Exploring the platform architecture and interface

Develop Build forms, reports, pages and workflows	Deploy Publish and share the application	Manage Administer users, settings and security
---	--	--

Interface and architecture summary

Zoho Creator follows a low-code application-building approach in which the major application components can be created through a visual interface. The development stage creates the application components, the deployment stage makes the application available to users, and the management stage handles administration and maintenance.

Result

Thus, a Zoho Creator account was set up and a sample Student Management application was designed. The creation and purpose of forms, reports and dashboards were studied, and the Develop, Deploy and Manage sections of the platform were explored. The experiment helped understand how Zoho Creator can be used to build and manage applications using a low-code approach.

Note: The interface figures in this document are clean illustrative representations for the experiment record, showing the relevant Zoho Creator components requested in the question.
